

## Medical Incident Report

### Incident Details

Patient Name: John Smith

Date of Incident: March 18, 2023

Description of Incident:

A 45 year old male presented to the Emergency Room with severe abdominal pain. Upon examination, it was discovered that the patient had suffered a ruptured appendix and required urgent surgical intervention. The patient was taken to the operating room and an appendectomy was performed. Following the surgery, the patient was monitored closely and is currently in stable condition.

#### Medical Assessment

After a 45 year old male presented to the Emergency Room with severe abdominal pain, an examination revealed a ruptured appendix and the patient required urgent surgical intervention. An appendectomy was performed in the operating room and the patient was monitored closely afterwards. The patient is currently in stable condition.

The medical assessment of the patient is that the appendectomy was successful and the patient is expected to make a full recovery with proper monitoring and follow-up care. The patient should follow up with a primary care physician for further follow-up and assessment. In addition, the patient should follow a healthy lifestyle with a balanced diet, exercise, and stress reduction to prevent further abdominal issues.

#### Treatment Plan

1. Monitor the patient closely for any signs of infection or bleeding, infection, and hernias.
2. Provide the patient with pain medications as needed.
3. Monitor the patient for possible complications such as bleeding, infection, and hernias.
4. Provide the patient with information about proper wound care and activity restrictions.
5. Refer the patient to a primary care physician for follow-up care and monitoring.
6. Refer the patient for physical therapy to help with mobility and pain management.

## Medical Incident Report

*7. Provide the patient with lifestyle advice about a balanced diet, exercise, and stress reduction.*

*8. Re-evaluate the patient in 1 week to ensure proper healing.*
