

## Medical Incident Report

### Incident Details

Patient Name: Maeve Winona

Date of Incident: October 28th, 2020

Description of Incident:

A forty-year-old female patient was admitted with a severe case of abdominal pain. Upon further examination, the patient was found to have an infection in the abdominal cavity, causing inflammation and a high fever. The patient was treated with a combination of antibiotics and fluids, and was kept under close observation for any signs of further infection. After several days of treatment, the patient's symptoms began to subside and she was eventually discharged with a clean bill of health.

### Medical Assessment

The patient is a forty-year-old female that was admitted with severe abdominal pain. Upon further examination, she was found to have an infection in the abdominal cavity, causing inflammation and a high fever. The patient was treated with a combination of antibiotics and fluids and was kept under close observation for any signs of further infection. After several days of treatment, the patient's symptoms began to subside and she was eventually discharged with a clean bill of health. Overall, the patient responded well to treatment and is now in stable condition.

### Treatment Plan

1. The patient will continue to take her prescribed antibiotics as directed for the next 5 days.
2. The patient should be monitored for any signs of further infection.

## Medical Incident Report

3. The patient should continue to drink plenty of fluids to stay hydrated.
4. The patient should continue to rest and take it easy to allow the body to heal.
5. The patient should follow up with her primary care physician within 2 weeks.
6. The patient should contact her doctor if symptoms worsen or persist.
