Medical Incident Report

Incident Details

Patient Name: Mikayla Tovar

Date of Incident: November 7th, 2002

Description of Incident:

A 32-year-old male patient presented to the emergency department with acute abdominal pain and nausea. He reported that the pain was intense and had been present for the past two hours. On physical examination, the patient had tenderness in his abdomen and his vital signs were within normal limits. Laboratory tests revealed elevated white blood cell count and a slightly elevated serum amylase level. An abdominal ultrasound was performed which showed a distended gallbladder with multiple stones and sludge. The patient was diagnosed with acute cholecystitis and was admitted for further observation and treatment.

Medical Assessment

Upon further assessment, the patient has been diagnosed with acute cholecystitis. The patients presentation, physical examination and laboratory results all suggest the presence of this condition. An abdominal ultrasound was performed which showed a distended gallbladder with multiple stones and sludge, confirming the diagnosis.

The patient is currently being monitored closely, and further treatment will depend on the patients clinical response. Treatment may include intravenous hydration, antibiotics, and possibly surgical intervention. The patient will be monitored for signs and symptoms of infection, dehydration, and pain. The patient should also be advised to follow-up with their primary care provider for further evaluation and management.

Medical Incident Report

Treatment Plan

1. Monitor patient closely for signs and symptoms of infection, dehydration, and pain.

2. Provide intravenous hydration and antibiotics as prescribed.

3. Consider surgical intervention as necessary.

4. Provide patient education regarding the risks and benefits of medical and surgical treatment options.

5. Refer patient to their primary care provider for further evaluation and management.

6. Monitor patients response to treatment and adjust accordingly.
